Title : Time factor in evaluation of excitability of tissues (In connection with the article written by Nasonov, D. N. and Rozental', D. L.)

Periodical : Fizol. zhur. 4, 504-509, Jul/Aug 1954

Abstract : The authors of this article criticize the article written in 1953 by D. N. Nasonov and D. L. Rozental' titled "Time Factor in Evaluation of Excitability of Tissues." In their article Nasonov and Rozental' question the value of chronaximetric methods and propose a new method. It is claimed that Nasonov and Rozental' are not justified in rejecting all chronaximetric methods previously used. Besides, it cannot be claimed that data obtained by using the new method is completely reliable. Raising the question of revaluation of the role of chronaximetry, however, is timely. It is necessary to recognize that chronaxy as a method needs modernization. Six Soviet references.

AUTHOR: Darlewski, Jan

TITLE: Machinability of plastics

PERIODICAL: Referativnyy zhurnal, Tekhnologiya mashinostroyeniya, no. 2, 1963, 7-8, abstract 2B23 (Mechanik, v. 35, no. 9, 1962, 508-511, Polish)

TEXT: In view of the increasing importance of plastics as a building material, the main problems connected with their machining are discussed. Thermal phenomena play a considerable role in the process of machining since the heat-conductivity of plastics is very low, which makes the heat elimination from the cutting zone difficult. In cutting it, one should avoid a certain critical temperature at which the fusion of the workpiece surface and the scorching of plastics begins. For many plastics the critical temperature is around 100°C. The cutting temperature is a function of the cutting speed. The effect of the feed on the temperature is considerably lower. The values of cutting resistance when turning and drilling textolite and other materials are given (according to data from a number

Card 1/2

S/276/63/000/002/001/052  
A052/A126

Machinability of plastics

of authors). Because of low temperatures and cutting forces no deformation of the cutting edge and its wear as a result of adhesion (sticking of material to the edge) and diffusion is observed. The wearing away of the cutting edge takes a very intensive course when plastics with inorganic fillers (glass fiber, asbestos, graphite) are machined. Data on the investigation of the tool wear in various kinds of machining are given. According to these investigations the tool wear can be reduced by using a sharply ground tool with a high-finish cutting edges. The wear depends also on the character of shavings. Recommendations are made on the technology of machining materials similar to those discussed. There are 13 figures.

Akademiya nauk Ukrainskoy SSR. Institut metallofiziki

Voprosy fiziki metallov i metallovedeniya (Problems in the Physics of Metals and Metallurgy) Kyiv, Izd-vo AN Ukrainskoy SSR, 1959. (Series: Itsa Sbornik nauchnykh rabot, No. 9) Errata. Allip inserted. 3,000 copies printed.

Min. of Publ. of Ukraine. Institute of Metal Physics, Acad. of Sciences, Tashkent. Translated from the original Russian edition by S.D. Gerdsman, Doctor of Physical and Mathematical Sciences; and I.Ya. Dzhidzgar, Doctor of Technical Sciences.

PURPOSE: This collection of articles is intended for scientific workers, engineers, and students in the fields of the physics of metals, metallurgy, and materials science. It may also be useful to students of advanced courses in metallurgical and physical sciences.

CONTENTS: This collection of articles deals with the following topics: effect of high-speed heating, heat treatment, deformations, and crystallization conditions on phase transformations, structures, and properties of metals and alloys; the effect of additional alloying components on volumetric and intercrystalline diffusion in alloys and the effect of repeated quench hardening and radioactive and ultrasonic treatment on the physical properties of alloys. No personalities are mentioned. References follow several of the articles.

Belyanov, L.M., S.D. Gerdsman, A.N. Shalayev, and N.I. Piontikova. Effect of Annealing on [REDACTED] Properties of the Ni<sub>3</sub>Mn Alloy. 173The article discusses the influence of  $\gamma$ -irradiation on longitudinal relaxation effects on the lattice parameter of the Ni<sub>3</sub>Mn Alloy (electrolytic Ni and 23 percent electrically Mn), and on the process of the real ordering.

Belitsky, I.G., and V.N. Belyanov. Effect of Alloping and Heat Treatment on the Plastic Properties of Nickel-Alloys. 178

The results of experimental investigation of the dependence of the modulus of elasticity on the composition and temperature of Ni-Cr and Ni-Mn alloys are presented. The effect of heat treatment on elastic properties of these alloys is discussed.

Ovlyanenko, D.Ye., and Ye.I. Sosulin. Influence of Aluminum Crystallization Conditions on the Crystal Structure of Aluminum Crystals. 185

The article reviews work done previously on investigations of the mosaic structure of cast aluminum (99.996 percent Al) crystals. The investigation takes into consideration of grain growth and eventual admixture of liquid mercury is used as an example.

TITLE: The Experience of Conversion of Oil-Fired Open-Hearth Furnaces  
to Natural Gas-Firing. (Opyt perevoda mazutnykh martenovskikh  
pechey na otopleniye prirodnym gazom, Russian).

PERIODICAL: Stal', 1957, Vol 17, Nr 1, pp 124 - 129 (U.S.S.R.)  
Received: 5 / 1957      Reviewed: 5 / 1957

ABSTRACT: In the course of 1956 - 1957 the furnaces of the "Krasnyy  
Oktyabr'" steel mills will be converted from Mazout-firing to  
natural gas-firing. At present the following furnaces in the USSR  
work with natural gas: three open-hearth furnaces of 50 t each,  
hot spots of an enamelling plant for disks, 15 thermal furnaces  
in a calibrating plant, 8 in a sheet working mill, drying furnaces  
in a electro-steel mill and one preheating furnace in a bolt  
and rivet department. The gas is burned by means of injection  
burners "Stal'proyekt" in the annealing furnaces and by means  
of combined gas-mazout-burners in open hearth furnaces. The  
characteristics of the open hearth furnaces and that of the gas  
are given, and the feeding of the gas into the furnaces and  
burners, flame regulation and control, the results obtained by  
the furnaces in operation, as well as the optimum heat conditions  
of the furnaces are described. In connection with the use of  
oxygen for blowing also the methods for burning natural gas in

Card 1/2

PA - 2395

The Experience of Conversion of Oil-Fired Open-Hearth  
Furnaces to Natural Gas-Firing.

connection with oxygen-blowing are improved. The change of the construction of the heads would be purposeful. The gas mazout burner developed by M.E.Groshev used in the mill cannot be regarded as perfect. The stabilization of the gas-mazout pressure before the burner is very important. In order to reduce the use of compressed air a natural gas compressed to an atmospheric excess pressure of 10 would have to be tried as sprayer. The consumption of mazout when using natural gas is very great (up to 37 % of the heat introduced into the furnace). For this reason experiments had to be carried out with the use of cracked natural gas in place of mazout. (7 illustrations).

A Four-Period System of the Complex Automatic Control of Thermal  
Conditions of a Fuel-Oil Fired Open Hearth Furnace.

and the beginning of the charging period of the next heat. Changing of programmes can also be hand operated. The scheme is shown in Fig.1. Fuel consumption is controlled according to the temperatures of the roof and regenerators. The following parameters are controlled: consumption of fuel oil, air-fuel ratio, amount of compressed air used in the atomiser, pressure of gases in the furnace, reverses, waste gas temperature at the bottom of the regenerators and draught in the waste gas flue. Characteristic data on the furnace on which the scheme was operated, operating practice and operating results are briefly described. The scheme operated satisfactorily, but the final conclusion regarding the efficiency of the scheme can be made only after an analysis of operating results of a few furnace campaigns. There are 9 figures.

In 101 patients with different chronic intrathoracical processes a symmetrical periostosis was looked for as one of the symptoms of the syndrome of hypertrophic osteoarthropathy. Of 58 patients with malignant intrathoracical processes, a pronounced symmetrical periostosis could be established in 3 cases; in 3 further cases it was only indicated. Of 43 patients with benign intrathoracical process, 1 case with indicated periostosis was found. The examinations correspond with the well-known fact that symmetrical periostosis in patients with a pneumopathy suspected to be carcinoma, confirms the malignancy, even though it is not pathognomonic for pulmonary carcinoma. TITLE: Results of experiments on deoxidation of titanium

SOURCE: Tsvetnyye metally, no. 9, 1966, 78-80

TOPIC TAGS: titanium alloy, titanium zirconium alloy, titanium gadolinium alloy, titanium yttrium alloy, titanium deoxidation, metal property, OXYGEN, ZIRCONIUM CONTAINING ALLOY, ALLOY COMPOSITION

ABSTRACT: The possibility of lowering the oxygen content in vacuum arc-melted titanium by alloying with zirconium, gadolinium or yttrium has been investigated. Commercial-grade titanium with addition of the above alloying elements was double melted in a vacuum of 0.012—0.1 mm Hg into 5 kg ingots 130 mm in diameter. It was found that zirconium lowers considerably the oxygen content. For instance, while unalloyed commercial-grade titanium contained 0.102% oxygen, an alloy with 1.5—2.5% Zr contained only 0.055—0.075% oxygen. Results of experiments with yttrium and gadolinium were inconclusive due to the

DARWIĘKIEWICZ T.

✓ Wartlewski L., Darwiękiewicz T. The Carrying-Away of Liquid Particles by Gases Escaping during Industrial Electrolysis Processes.

"Porywanie cieczy przez gazy powstające podczas elektrolizy przemysłowej" (Prace Centr. Inst. Ochr. Pracy No 3(8)). Warszawa, 1953, PWT, 4 pp., 2 figs.

The authors attempt to analyse the rate of contamination of air in zinc electrolysis plants. Special formulae were computed to determine both quantities and quality of gases (hydrogen and oxygen) emitted per unit of time. The degree of contamination in the gases escaping was measured, and a quantitative analysis made. The concentration of contaminating particles in various parts and at various levels of the premises was also determined. It was found that the contamination in the form of fog, forming as a result of the electrolyte being carried away during numerous processes of industrial electrolysis, consists mainly of zinc sulphate and, to a lesser degree, of sulphuric acid and water. These form, with air, a heterogeneous system. The contaminating particles conglomerated heavily while rising, and were precipitated, causing a steady drizzle in the premises. The quantities of the precipitation thus formed were measured at different levels of the premises. It was found that the major part of precipitations accumulated at the lowest level above the baths. A maximum concentration of the contaminating particles was also noticed in the lower part of the premises, whereas it is several times less in the upper strata. The data obtained make it possible to form an idea as to the quantitative significance of this phenomenon. They also indicate possibilities for the constitutional solution of problems involved in designing ventilation systems.

Four cases are reported, showing the difficulties of the critical evaluation of biopsy material, especially in frozen sections. The carcinoid seems to be more benign than the cylindroma. The histological appearance, however, does not show always strict parallelism with the biological behaviour of the tumours. Histologically benign adenomas may develop metastases and a certain polymorphism does not absolutely signify malignancy. The histological picture should be interpreted with great discrimination and only in connection with the clinical course.
